MOBILE / WEB APPLICATION DESIGN

Personalized Interface and Theme Designer

PROJECT REPORT

Project Title	Personalized Interface Designer
Platform	Mobile or Web Application
Main Features	Theme selection, menu arrangement, live preview, and saved preferences
Project Focus	A practical UI/UX design and application concept

A simple application concept for a more personal and accessible digital experience.

This report follows the same overall structure as the reference, with a revised project title, wording, and examples.

1. INTRODUCTION

The Personalized Interface and Theme Designer is a mobile or web application concept that helps users adjust the look and navigation of an interface. Users can select a theme, choose a background colour, arrange menu options, preview their choices, and save the final settings. The application is designed to make personalization easy for beginners.

2. PROBLEM STATEMENT

Many digital applications offer only a few appearance settings. Users may find the default colours difficult to read or the menu arrangement inconvenient. A single customization area can make these options easier to discover and manage, while allowing users to preview changes before applying them.

3. OBJECTIVES

- Provide a selection of ready-made interface themes.
- Allow users to choose a background colour.
- Offer simple menu layout and visibility controls.
- Display a preview before changes are saved.
- Include Apply, Reset, and Cancel options.
- Keep text, icons, and controls clear and readable.

4. PROPOSED APPLICATION

The application contains a Home screen, a Theme Settings screen, and a Preview screen. From the Home screen, users open the customization area, select a theme or colour, adjust the menu, and inspect the preview. They can then apply the settings or restore the original design. The concept can be developed as a responsive website or adapted for mobile devices.

5. MAIN FEATURES

5.1 Theme and Colour Selection

Users can choose from preset themes such as Ocean Blue, Soft Lavender, Mint Green, Warm Sand, and Night Mode. A custom colour picker can provide additional choices. The preview changes as the user makes a selection.

5.2 Menu Arrangement

Users can select top navigation, a side panel, or bottom navigation. Optional menu items can be shown or hidden, and supported items can be reordered. Important destinations such as Home and Settings remain easy to locate.

5.3 Instant Preview

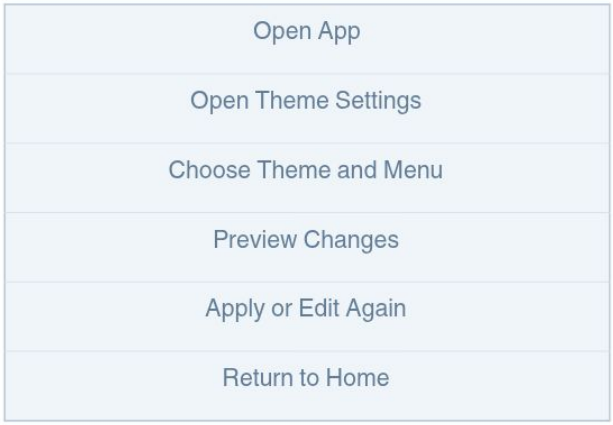

The preview displays the selected colours and menu layout before the user applies them. This helps users check readability and confirm that the interface looks as expected.

5.4 Apply and Restore

Apply saves the chosen settings, Restore returns the interface to its default appearance, and Cancel leaves the current settings unchanged.

6. USER FLOW

Open Application → Home Screen → Theme Settings → Select Theme or Colour → Arrange Menu → Preview → Apply Settings → Return to Home.

If the preview is not suitable, the user returns to the settings screen, makes adjustments, and previews again before applying.

7. INTERFACE SCREENS

Screen 1: Home Screen

- Displays the application name and main content.
- Shows the currently applied theme and navigation.
- Provides a clear button to open Theme Settings.

Screen 2: Theme Settings

- Displays preset theme cards and a custom colour option.
- Provides menu layout choices and optional-item switches.
- Includes a button to open the live preview.

Screen 3: Preview Screen

- Shows the selected colours, text, icons, and menu arrangement.
- Allows the user to check visibility and readability.
- Provides Apply, Restore, and Cancel controls.

Example Menu Items

- Home
- Explore
- My Workspace
- Alerts
- Profile

• Settings

8. THEME AND MENU LOGIC

• When a theme card is selected, the preview updates its colours.

• When a custom colour is chosen, the preview background changes to match.

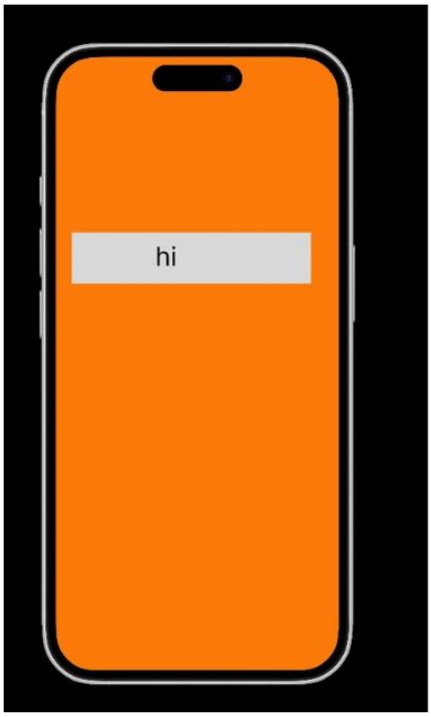

• When a menu layout is selected, the navigation arrangement changes.

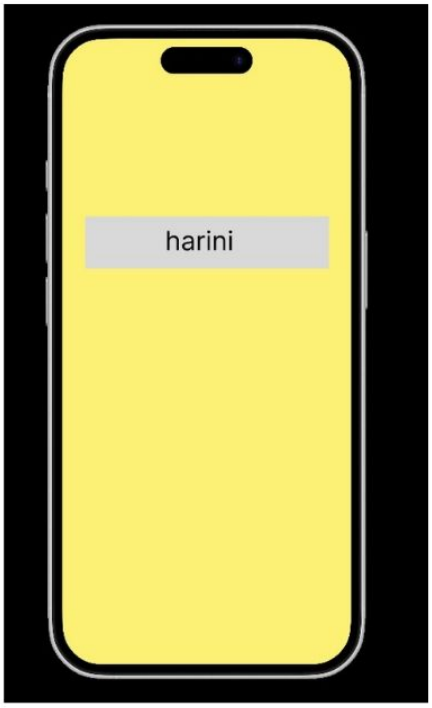

• When an optional-item switch is turned off, that item is hidden from the preview.

• When Apply is selected, the chosen preferences become the active settings.

• When Restore is selected, the default theme and menu are displayed.

• Text and controls should maintain sufficient contrast for comfortable reading.

9. TESTING PLAN

• Confirm that each preset theme can be selected.

• Check that background changes appear in the preview immediately.

• Verify that each menu layout is displayed correctly.

• Check that hidden menu items do not appear in the preview.

• Confirm that Apply saves the selected preferences.

• Confirm that Restore returns the interface to its defaults.

• Test the layout on different mobile and desktop screen sizes.

• Check text contrast and touch or keyboard accessibility.

10. EXPECTED OUTCOME

The expected outcome is an easy-to-use application concept that lets users personalize an interface without technical knowledge. Theme presets, menu controls, and a live preview make the customization process clear. Apply and Restore options help users manage changes with confidence.

11. FUTURE ENHANCEMENTS

• Allow users to create and save several custom themes.

• Add font-size and text-style controls.

• Provide more icon styles and menu designs.

• Support drag-and-drop menu ordering.

• Synchronize preferences across devices through a secure account.

12. CONCLUSION

The Personalized Interface and Theme Designer presents a simple way to customize the appearance and navigation of a mobile or web application. By combining theme selection, menu arrangement, preview, and saved preferences, it gives users more control while keeping the design straightforward and accessible.

PROJECT SUMMARY

Input	User-selected theme, colour, and menu settings
Process	Update preview, check readability, and apply preferences
Output	A personalized mobile or web interface
